

Detect Breast Disease Sooner with Thermography Screenings

At the Naturopathic Family Clinic

The Naturopathic Family Clinic is pleased to announce the availability of breast thermography screenings. Breast Thermography (or Digital Infrared Thermal Imaging, or DITI) is a state of the art method for early detection of breast disease not yet offered in Janesville.

Thermography is *noninvasive, painless, and radiation-free*. There is no breast compression in thermography. It uses infrared heat sensing technology to detect the slightest temperature difference in the tissue. By detecting minute variations in breast tissue temperature, thermography may detect signs suggesting a pre-cancerous state of the breast or the presence of an early tumor that is not yet large enough to be detected by physical examination, mammography, or other types of structural imaging.

- Current research shows 1 in 8 women in the US will get breast cancer in their lifetime
- Cure rates greater than 95% are possible if treated in its earliest stages
- Data shows that thermography can identify precancerous changes much earlier than any other technique

Screenings will occur as one-day events happening only once every 3 months. Call the clinic to learn more and to schedule your screening.
